

Internal User Console

Objective

Build a React-based internal tool that helps view, search, filter, and analyze user-related data. All data will be loaded from static CSV files (simulating API responses).

Pages to Build

1. Users List View

 Route: /users

- Table view with: User ID, Name, Join Time, Status (New/Returning/Deleted), Last Active Time

- Features:
 - Sort by Join Time
 - Filter by Status
 - Search by Name or User ID
 - Clicking User ID navigates to User Details

2. User Details View

 Route: /user/:id

- Display:
 - Join Time, App Version, Device Info, Location, Language
 - Profile Picture thumbnail (click to enlarge in modal)
- Features:
 - Search by User ID
 - Navigate back to User List

3. User Sessions View

 Route: /user/:id/sessions

- Table view of user sessions with:
 - Session Start, Duration (minutes), Device, Entry Screen, Exit Screen
- Features:
 - Filter by device
 - Sort by session duration

4. Analytics Dashboard

 Route: /analytics

- Charts:
 - Daily Active Users (line chart)

- New vs Returning Users (pie chart)
 - App version distribution (bar chart)
- Show metrics:
 - Total Users, Average Session Duration, Deleted User %

Data Files Provided

All data is stored as CSV (parse using PapaParse or similar):

- users.csv – basic user info
- user_profiles.csv – extra user metadata
- user_sessions.csv – login sessions
- analytics.csv – aggregated metrics per day

Core Expectations

- Responsive layout
- Data filtering, sorting, searching
- Modals and routing should be functional
- Code should be modular and reusable

Bonus Ideas

- Persist filters using localStorage or query params
- Add light/dark theme toggle
- Export filtered data to CSV
- Add keyboard accessibility (Tab focus, Esc to close modal)
- Deploy to Vercel/Netlify and share the URL
